

START HERE

Developing cross-platform CPython extensions

1. Create simple **examplemodule/CMakeLists.txt** describing the extension

```
cmake_minimum_required(VERSION 2.8.9)

project(examplemodule)

find_package(Python REQUIRED CONFIG)
include_directories(${PYTHON_INCLUDE_DIRS})

add_library(example MODULE examplemodule.cxx)
target_link_libraries(example ${PYTHON_LIBRARIES})
set_target_properties(example PROPERTIES PREFIX "")
```

2. Create **examplemodule.cxx** implementing the extension

3. Configure and build

```
mkdir examplemodule && cd $_
cmake -DPython_DIR=${HOME}/scratch/python-build ../examplemodule
make -j4
```

Require CMake >= 2.8.9

github.com/jcfr/python-cmake-custom-extension

Motivation

- Maintainable build system
- Easy embedding of CPython
- Built-in support for cross-compilation
- First class support for Visual Studio

# CMake build system for CPython

Simple with built-in support for cross-compilation.

Jean-Christophe Fillion-Robin, Matt McCormick

What is CMake ?

- One simple language for all platforms
- Generates native build system
- Cross-platform
- Open-source – BSD-like license
- Self-contained – No dependencies
- Large community

CMake generators

A CMake Generator is responsible for writing the input files for a native build system.

Use cmake -G option to specify the generator for a new build tree.

Extra Generators for auxiliary IDE

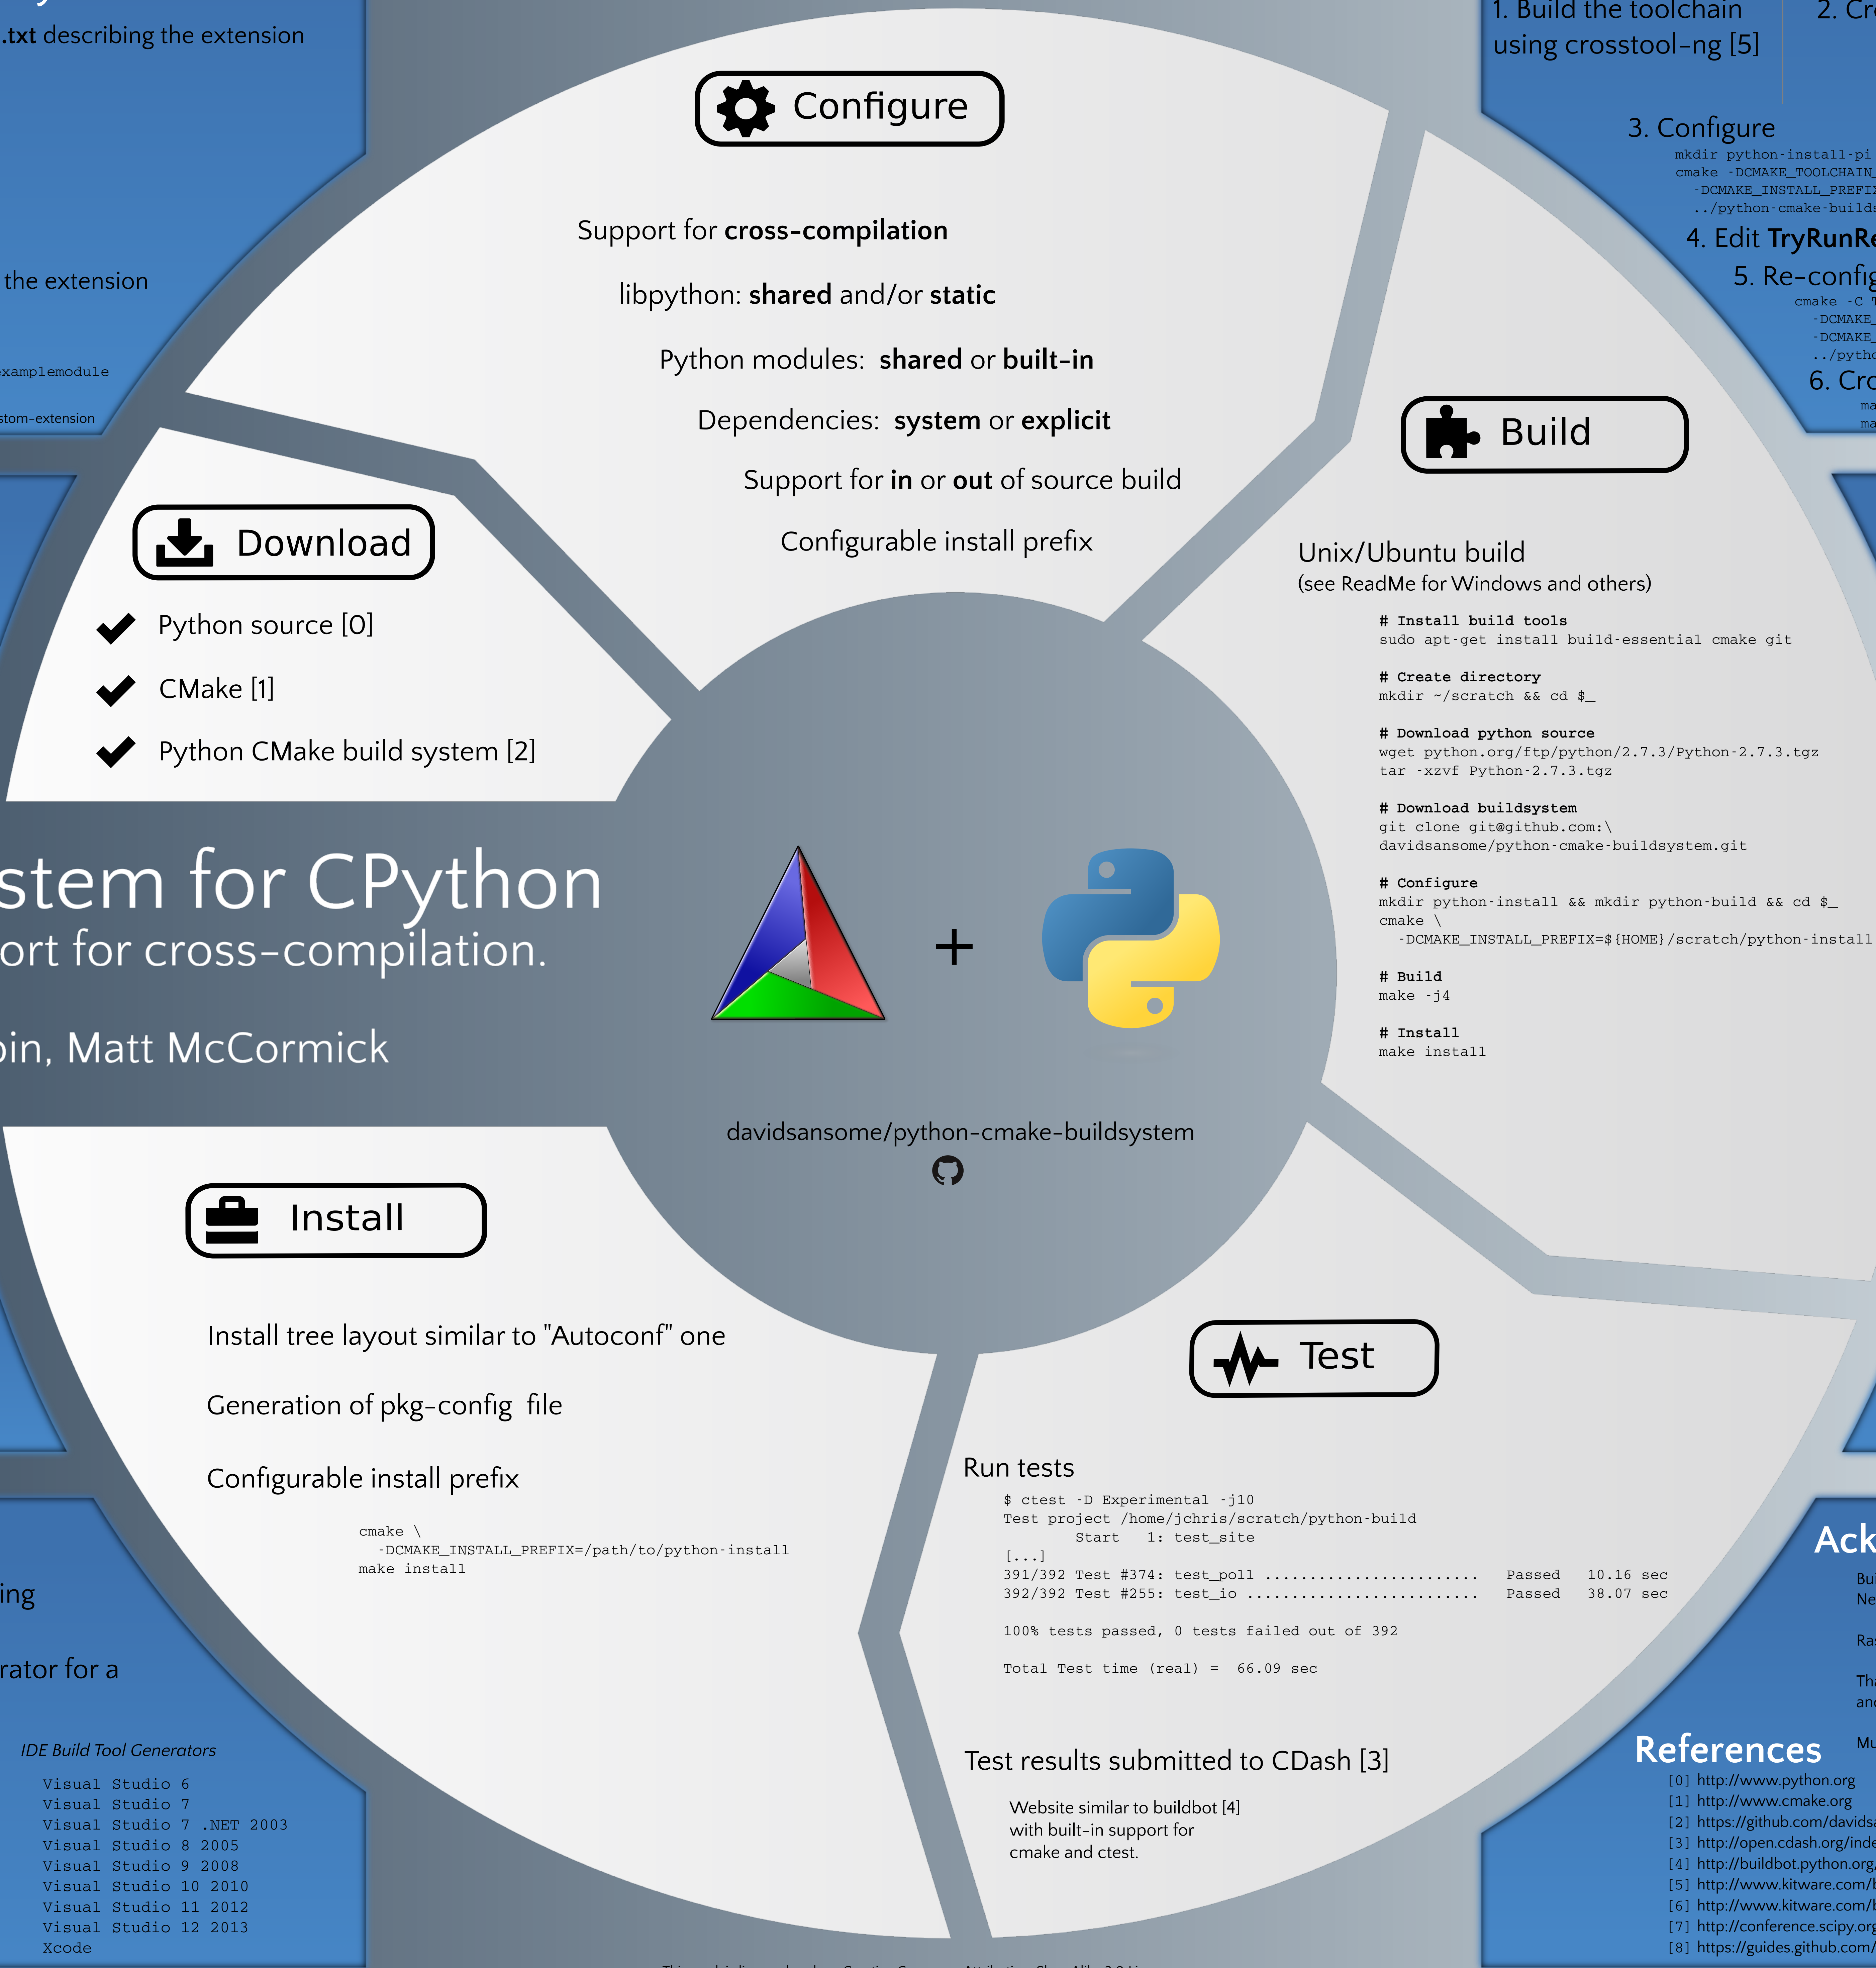

CodeBlocks  
CodeLite  
Eclipse CDT4  
KDevelop3  
Kate  
Sublime Text 2

Command-Line Build Tool Generators

Borland Makefiles  
MSYS Makefiles  
MinGW Makefiles  
NMake Makefiles  
NMake Makefiles JOM  
Ninja  
Unix Makefiles  
Watcom WMake

IDE Build Tool Generators

Visual Studio 6  
Visual Studio 7  
Visual Studio 7 .NET 2003  
Visual Studio 8 2005  
Visual Studio 9 2008  
Visual Studio 10 2010  
Visual Studio 11 2012  
Visual Studio 12 2013  
Xcode

Cross-compiling for RaspberryPi

1. Build the toolchain using crosstool-ng [5]

2. Create **Toolchain-RaspberryPi.cmake** [6]

```
[...]
set(CMAKE_C_COMPILER
  ${toolchain}/bin/arm-unknown-linux-gnueabi-gcc)
set(CMAKE_FIND_ROOT_PATH
  ${toolchain}/arm-unknown-linux-gnueabi/sysroot)
[...]
```

3. Configure

```
mkdir python-install-pi && mkdir python-build-pi && cd $_
cmake -DCMAKE_TOOLCHAIN_FILE=/path/to/Toolchain-RaspberryPi.cmake \
  -DCMAKE_INSTALL_PREFIX=/home/jchris/scratch/python-install-pi \
  ../python-cmake-buildsystem
```

4. Edit **TryRunResults.cmake** with expected values

5. Re-configure

```
cmake -C TryRunResults.cmake \
  -DCMAKE_TOOLCHAIN_FILE=Toolchain-RaspberryPi.cmake \
  -DCMAKE_INSTALL_PREFIX=/home/jchris/scratch/python-install-pi \
  ../python-cmake-buildsystem
```

6. Cross-compile

```
make -j4
make install
```

7. Upload to target

Ubuntu 13.10 / CMake 2.8.9

Future work

Support 2.7.8 and 3.x

Document CMake buildsystem using sphinx.

Setup Travis CI

Setup dashboard for RaspberryPi

First class support for frozen module [7].

Integrate SetupTools with CMake

Contributing

Follow the Github flow [7]:

- 🔗 Create a branch
- 🔗 Open a Pull Request
- 🔗 Test
- 🔗 Discuss and review
- 🔗 Merge

Acknowledgments

Build system based on the original work of David Sansome, Alex Neundorf and David DeMarle.

RaspberryPi cross compilation based on work of Luis Ibañez [5][6].

Thanks to David Thompson for his poster feedback, and thanks to Mysha Sissine for her support.

Much of this work was supported by the National Institutes of Health.
