Developing cross-platform CPython extensions

1) Create simple examplemodule/CMakeLists.txt describing the extension

project(examplemodule) find_package(Python REQUIRED CONFIG) include_directories(\${PYTHON_INCLUDE_DIRS}) add_library(example MODULE examplemodule.cxx) target_link_libraries(example \${PYTHON_LIBRARIES}) set_target_properties(example PROPERTIES PREFIX "")

cmake_minimum_required(VERSION 2.8.9)

(2) Create **examplemodule.cxx** implementing the extension

(3) Configure and build mkdir examplemodule && cd \$_ cmake -DPython_DIR=\${HOME}/scratch/python-build ../examplemodule make -j4

github.com/jcfr/python-cmake-custom-extension

Require CMake >= 2.8.9

Motivation

- Maintainable build system
- Easy embedding of CPython
- Built-in support for cross-compilation
- First class support for Visual Studio

Python source [0]

CMake [1]

Python CMake build system [2]

Install

Generation of pkg-config file

CMake build system for CPython Simple with built-in support for cross-compilation.

Jean-Christophe Fillion-Robin, Matt McCormick

What is CMake?

- One simple language for all platforms
- Generates native build system
- Cross-platform
- Open-source BSD-like license
- Self-contained No dependencies
- Large community

CMake generators

A CMake Generator is responsible for writing the input files for a native build system.

Use cmake - G option to specify the generator for a new build tree.

Extra Generators for auxiliary IDE

CodeBlocks CodeLite

Eclipse CDT4 KDevelop3 Kate Sublime Text 2 Command-Line Build Tool Generators

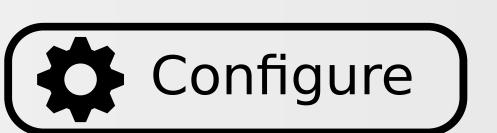

Borland Makefiles MSYS Makefiles MinGW Makefiles NMake Makefiles NMake Makefiles JOM Ninja

Unix Makefiles

Watcom WMake

IDE Build Tool Generators

Visual Studio 6 Visual Studio 7 Visual Studio 7 .NET 2003 Visual Studio 8 2005 Visual Studio 9 2008 Visual Studio 10 2010 Visual Studio 11 2012 Visual Studio 12 2013 Xcode

Support for cross-compilation

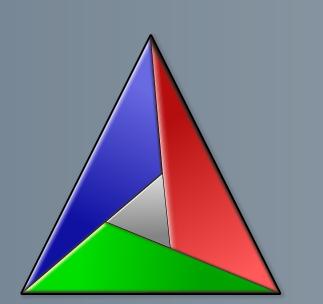

libpython: shared and/or static

Python modules: shared or built-in

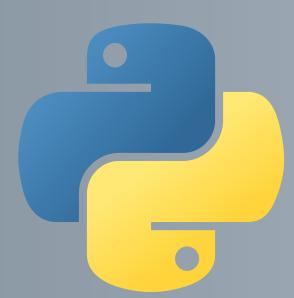

Dependencies: system or explicit

Support for in or out of source build

Configurable install prefix

davidsansome/python-cmake-buildsystem

Cross-compiling for RaspberryPi

(1) Build the toolchain using crosstool-ng [5]

(3) Configure

② Create Toolchain-RaspberryPi.cmake [6] set(CMAKE_C_COMPILER \${toolchain}/bin/arm-unknown-linux-gnueabi-gcc)

set(CMAKE_FIND_ROOT_PATH \${toolchain}/arm-unknown-linux-gnueabi/sysroot)

mkdir python-install-pi && mkdir python-build-pi && cd \$_ cmake -DCMAKE_TOOLCHAIN_FILE=/path/to/Toolchain-RaspberryPi.cmake \ -DCMAKE_INSTALL_PREFIX=/home/jchris/sratch/python-install-pi \ ../python-cmake-buildsystem

4 Edit TryRunResults.cmake with expected values

5 Re-configure

cmake -C TryRunResults.cmake -DCMAKE_TOOLCHAIN_FILE=Toolchain-RaspberryPi.cmake -DCMAKE_INSTALL_PREFIX=/home/jchris/sratch/python-install-pi ../python-cmake-buildsystem

6 Cross-compile 7 Upload to target

Ubuntu 13.10 / CMake 2.8.9 make install

Unix/Ubuntu build (see ReadMe for Windows and others)

Install build tools sudo apt-get install build-essential cmake git

Build

Create directory mkdir ~/scratch && cd \$

Download python source wget python.org/ftp/python/2.7.3/Python-2.7.3.tgz tar -xzvf Python-2.7.3.tgz

Download buildsystem git clone git@github.com:\ davidsansome/python-cmake-buildsystem.git

Configure

mkdir python-install && mkdir python-build && cd \$_ -DCMAKE_INSTALL_PREFIX=\${HOME}/scratch/python-install

Build make -j4

Install make install

Future work

Support 2.7.8 and 3.x

Document CMake buildsystem using sphinx.

Setup Travis CI

Setup dashboard for RaspberryPi

First class support for frozen module [7].

Integrate SetupTools with CMake

Contributing

Follow the Github flow [8]:

Create a branch

Merge

Configurable install prefix

cmake \

Install tree layout similar to "Autoconf" one

-DCMAKE_INSTALL_PREFIX=/path/to/python-install make install

Run tests

\$ ctest -D Experimental -j10 Test project /home/jchris/scratch/python-build Start 1: test_site [...]

391/392 Test #374: test_poll Passed 10.16 sec 392/392 Test #255: test_io Passed 38.07 sec

100% tests passed, 0 tests failed out of 392

Test results submitted to CDash [3]

Total Test time (real) = 66.09 sec

Website similar to buildbot [4] with built-in support for cmake and ctest

Acknowledgments

Build system based on the original work of David Sansome, Alex Neundorf and David DeMarle.

RaspberryPi cross compilation based on work of Luis Ibañez [5][6].

Thanks to David Thompson for his poster feedback, and thanks to Mysha Sissine for her support.

Much of this work was supported by the National Institutes of Health, Roadmap Initiative for Medical Research under grant U54 EBO05149.
